Wanted
Front End Developer

We're Personify Care, an Adelaide-based digital health company. We build elegantly simple tech that makes it easier for patients to recover from health issues, saves clinicians time and saves hospitals money. Among other things, we believe that the experience of a patient recovering from serious health issues should be as convenient as shopping online.

The Project

The project involves converting front-end designs into an HTML5 template with functional javascript interactions. The designs are available on invision or as image assets. An existing bootstrap template and graphical elements are also provided. We need to implement a functional front end interface based on graphical designs. This involves implementing up to 10 screens, with some CRUD interactions. We anticipate the project would take and experienced developer 1 weeks' worth of effort.

You'll be working with our team in Adelaide (based in our Norwood office).

About You

We are looking for an experienced front-end developer to complete this project so that we can:

1. Fast-track the development of one of our key modules
2. See if working together is a good fit for future work (or future roles within our team)

The ideal person should be enthusiastic, a good communicator, take pride in their work and have an interest in working in the health sector.

Requirements

- At least 3 years experience in web development
- HTML5 / CSS3 (Bootstrap)
- Javascript (jQuery)

Desirable:

- PHP
- Automation tools
- Health sector experience
