This is the application that runs on the Computer whose screen is being captured.

1 Capture On/Off Button

push-button style - when pushed in its 'on', not pushed in is 'off'.
When On:

- starts timer which fires every x ms (as per selection in 'Capture Screenshot every' combo box)
- captures screenshot of full screen of selected monitor (as per selection in 'Screen to Capture' combo box).
- Compares screenshot with previous screenshot and if different writes screenshot to local hard-drive.

2 Pause Button

push-button style - when pushed in screenshot timer is paused (so screenshots are not taken).
Allows screenshot process to be paused whilst user does some action they don't want recorded without completely stopping the entire screen capture series.

3 Screen to Capture

On Load, application identifies the different screens connected to computer and builds combo box with connected screens to allow user to choose which screen is captured.
Default is Primary Monitor according to Operating System.

4 Capture Screenshot every

500 ms (0.5 second)
1000 ms (1 second) default
2000 ms (2 seconds)
3000 ms (3 seconds)
4000 ms (4 seconds)
5000 ms (5 seconds)
